

Securing external clients and internal infrastructure

Universal Security Device – BusinessCube

Digital connectivity creates new business opportunities: Employees can work from home, at office branches, or on the road. Readily available LAN access or WiFi access points at airports, hotels, employee homes enable workers to be productive almost every where.

But remote work requires access to sensitive company data. While working in a mobile setting is very comfortable, it brings with it increased business risks. AVI security has developed and deployed a transnational security system for many years.

The so-called CryptoNet has been in use for several years by customers like security companies, high-security data centers, and many others. The BusinessCube allows companies to secure connections emanating from Laptops, Smartphones, tablets. Manage remote working employees, partners, or clients can now as easy as if they were on-premises.

CryptoNet core features: High-End firewall, AES VPN and content filter

Our requirements for IT-Security are infinitely high

The BusinessCube - No matter if PC, laptop, tablet, smartphone, or IoT. Support for all Operating Systems like mac OS, Windows, Android, iOS, and others. All can be easily connected and optimally secured, no matter if they are mobile or locally installed.

The CryptoNet - is an international server network build from the ground up with decades of Know-How and Know-Why in the field of IT-Security. It is made up of self-owned, optimized, physically secured bare-metal servers. Each server features a high-end firewall, AES-VPN, content filter, and other security measures.

The AVI security team - was born out of the IT security department of the DACS Laboratories GmbH, ex-military, and IT security experts. The team has secured networks for clients in the aerospace, metal industries, as well as insurances and many SMBs.

One of the core features - is the worldwide unique AES (Automated, Efficient, Secure) VPN. It is the only VPN solution employing an automated, randomized key exchange that replaces all key material in user-defined time intervals.

Advantages at a glance:

- ** Client connectivity for all kinds of applications
- ** Proven high - security procedures
- ** Easy integration into existing networks
- ** Comfortable central management
- ** Mobile All in One IT Security - Plug & Secure
